What meds are you prescribing? Read about a new study that suggests many common prescription medications increase depression risk. Plus, check out our new clinical marketing materials and get ready to see us at IMMH in Dallas!

Industry News.

200 Prescription Meds Increase Depression Risk, Study Finds

More than one-third of U.S. adults are taking prescription medications that may lead to depression, new research finds. The [study](#), published in *JAMA*, warns that depression is a potential side effect of more than 200 commonly prescribed medications, including beta blockers for blood pressure, birth control pills, antacids, and painkillers

Fight the cycle. [Ask us](#) how you can use eVox to detect medication side effects, and to perform biofeedback and neurofeedback therapeutic interventions.

Evoke News.
